

Generate Sequential Values

It is sometimes convenient to be able to create a variable that simply consists of a sequence of values for N cases. Sometimes it is desired that the sequence start at a specific value for case 1 and subsequent cases have values incremented by some value X. This procedure provides that capability as shown in the specification form below and a snap-shot of the values generated in the data grid.

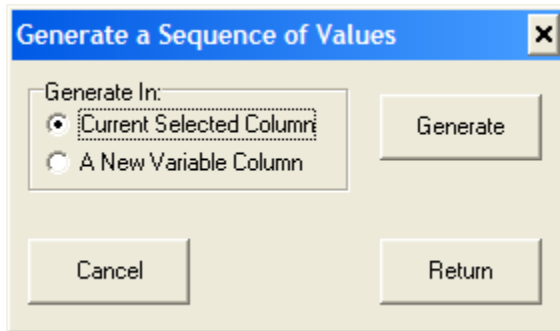

Figure 1 Dialog to Generate a Sequence of Values

Before you run this procedure, it assumes you already have N cases in the data grid. Click on the column in the data grid where you want to create the sequence of values then evoke this procedure.
